## Transitioning to Data-Driven Solid Waste Management in the Municipality of Bacolod

### EXECUTIVE SUMMARY

The Municipality of Bacolod faces persistent challenges in implementing the national mandate for ecological solid waste management (SWM). Current administrative strategies rely on historical heuristics, such as spreading budgets equally across all barangays and relying heavily on passive information campaigns. Recent computational research utilizing Deep Reinforcement Learning (DRL) and Agent-Based Modeling reveals that these traditional methods are structurally flawed, leading to wasted resources and political backlash. This brief outlines a proposed Data-Driven Solid Waste Management (DD-SWM) Framework, providing municipal leaders with an evidence-based, algorithmic roadmap to achieve sustainable, high-compliance waste segregation.

### THE CHALLENGE: STRUCTURAL FLAWS IN CURRENT SWM POLICY:

1. **The Dilution Effect of "Equal Distribution":** Distributing the municipal SWM budget equally across all barangays (the "peanut-buttering" effect) prevents the Local Government Unit (LGU) from achieving the critical density of enforcement or incentives required to change behavior in highly populated, resistant urban centers like Barangay Poblacion.
2. **The Value-Action Gap:** Simulation data indicates that the "Cost of Effort" is the dominant inhibitor of compliance (accounting for 83% of policy failure). Citizens often possess high environmental awareness but fail to segregate because the physical friction—such as the cost of buying segregation sacks or the lack of reliable collection vehicles—is too high. Passive Information, Education, and Communication (IEC) campaigns cannot solve physical barriers.
3. **The Political Cost of Pure Enforcement:** Heavy-handed penalization without prior behavioral conditioning or adequate infrastructure is politically brittle. The simulation models predict a "Political Collapse" by Quarter 2 if a "Pure Enforcement" strategy is used, trapping the LGU in a cycle of public resentment and resistance.

### THE EVIDENCE: INSIGHTS FROM AI SIMULATION

Computational experiments simulating human behavior and municipal resource allocation in Bacolod yielded three critical insights:

- Sequential targeting of specific barangays is mathematically superior to simultaneous, municipal-wide rollout.

# Policy Brief: Transitioning to Data-Driven Solid Waste Management (DD-SWM) in the Municipality of Bacolod

- Civic behavior becomes self-sustaining through peer pressure once a "Social Tipping Point" of approximately 70% compliance is reached.
- Subsidizing the physical mechanics of segregation (e.g., free bins) yields exponentially higher compliance than spending on attitude-shifting IEC campaigns.

## ACTIONABLE POLICY RECOMMENDATIONS

**Recommendation 1:** Legislate Algorithmic Resource Targeting (Sequential Saturation) The Sangguniang Bayan (SB) and the Mayor's Office must abandon static, equal-share appropriation ordinances. The LGU should adopt a "Phased Rollout" strategy, legally ring-fencing the majority of the quarterly Maintenance and Other Operating Expenses (MOOE) budget to saturate one high-priority "Pilot Zone" (e.g., Poblacion) before transitioning resources to rural areas. This approach uses the AI's recommendations as a mathematical shield to depoliticize unequal budget distribution.

**Recommendation 2:** Shift Budget from Awareness (IEC) to Friction Reduction The Municipal Environment and Natural Resources Office (MENRO) must pivot its budget toward physical convenience. The LGU should pool resources to provide free, standardized segregation receptacles to vulnerable households (e.g., in Liangan East) to remove the financial barrier to entry. Furthermore, capital must be prioritized for logistical hardware maintenance (e.g., repairing damaged collection vehicles) to ensure the physical act of waste disposal is effortless.

**Recommendation 3:** Adopt "Pulsed" Enforcement and the "Graduation Rule" To protect the administration's political capital, MENRO should avoid uniform, permanent ticketing. Instead, enforcement should be "pulsed"—applied strictly during the initial rollout in a specific barangay to break resistance, then immediately scaled back. Furthermore, the LGU should institute the "Graduation Rule": once a barangay achieves 70% compliance, its funding must be drastically reduced to a fractional "maintenance budget," freeing up capital to target the next resistant barangay.

**Recommendation 4:** Institutionalize Predictive Policy Prototyping The LGU should formally integrate predictive modeling into its legislative process. By utilizing customized decision-support systems (a "Digital Twin" of the municipality), administrators can input demographic shifts, logistics, and budget constraints to simulate the outcomes of municipal ordinances before they are enacted. This will permanently shift Bacolod from reactive enforcement to proactive, evidence-based governance.
